

Secrets to Achieving End-to-End Email Security

Phishing and spear phishing tactics are nothing new. They have been and continue to be a pervasive entry point into the advanced persistent threat types of attacks launched against corporate users and their accounts.

- Cyber criminals continue to use these tactics because they work. Security practitioners are seeing increased phishing and spear phishing activity and predict accelerated, continued growth.
- 85% of the volume of email received by organizations from the outside, 85% of is either spam or a phishing attempt.
- Organizations are challenged in protecting their corporate users as traditional spam filters and mail filters fail to solve the underlying problem in achieving end-to-end email security.
- Corporate users expect high levels of protection. Filtering out nonsense and dangerous emails is now considered table stakes by corporate users, especially executives.
- The problem extends to the home. About 50% of organizations allow email access from home. Security professionals must take this need into consideration when deploying email security solutions.
