

The Security 2025 Project

As a community, we need to unite and define the new North Star of enterprise security. For the last 20 years, we have reactively implemented monolithic, ineffective solutions that are not integrated and introduce complexity, resource drag, and alert fatigue. How can we challenge ourselves to a new way of thinking? What do we want our security stack to look like by 2025?

Security 2025 is a research project focused on building a new, sustainable security blueprint. Through collaboration that leverages our real-world experience and knowledge as security leaders, we will help rebuild, design and architect our future, using recent innovations and new operating models in order to upend the existing security paradigm. Join us and help create a strategic guide will both demonstrate how every security program should be architected and operationalized to achieve organizational effectiveness by 2025 and also inspire the industry to innovate and use our approach. The finished research will be delivered in a book, with all authors and research contributors credited.

QUESTIONS SECURITY 2025 LEADERS ARE ADDRESSING

How will your business shift over the next 5-7 years?

What are the biggest risk factors to your business?

How many connected devices will your company be responsible for securing?

What are the three must haves for your business to maintain and increase profitability?

What must security teams stop doing to enable a new approach to security?
