

{S} Saltworks

Partnering with organizations to build world-class application security programs from Policy to Production

Application Security That Won't Slow You Down

The demands of today's market won't let software development wait for security to catch up. Saltworks has the expertise and experience to help you take your program from planning to reality quickly, efficiently, and predictably.

We engage, execute, and deliver.

Do it Right From the Start

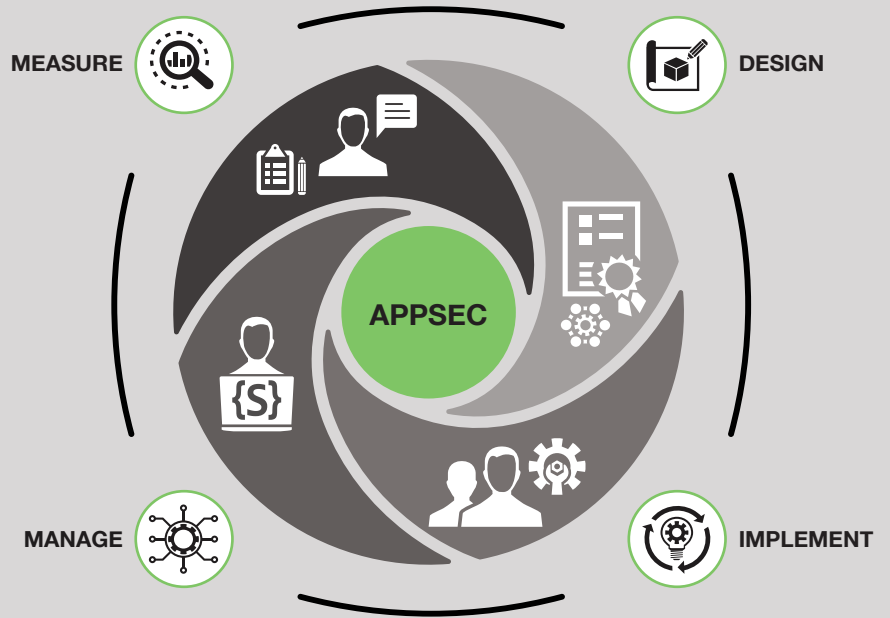

Software development lifecycles must adapt to include application security activities from the beginning. Our application security experts work closely with your engineering team to create and manage customized application security programs that work with – not against – your established software development culture and environment.

Saltworks Helps Enterprises:

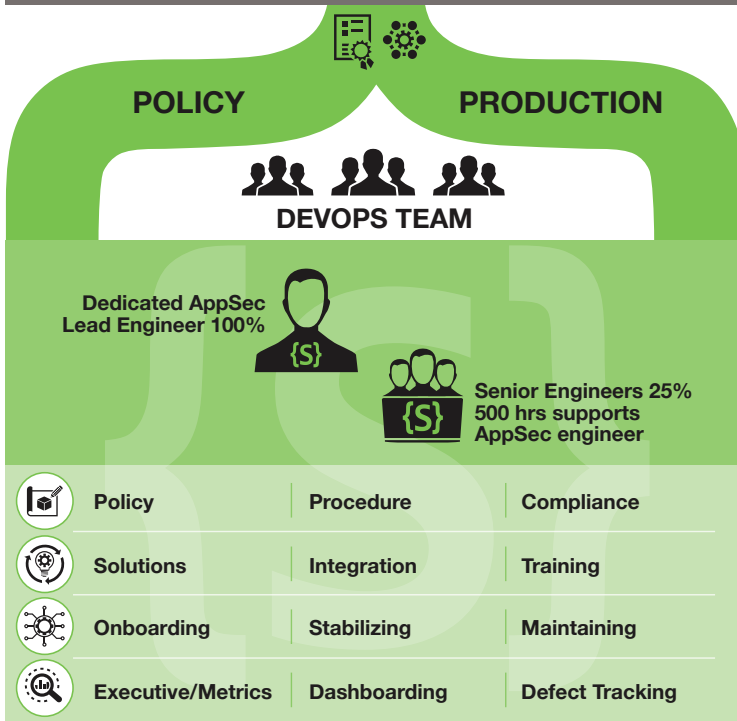

- Deliver secure, reliable applications faster
- Align development, security, QA and operations teams while developing a secure SDLC
- Streamline and implement processes from policy to production
- Access expertise and premium support for a fraction of the cost to hire in-house

A Unique Mix of Team, Tools, and Training

We assemble the right team, expertise, tools and training you need to achieve your business goals. As an extension of your team, we focus on weaving security into the DNA of your software development lifecycle and help you create and manage application security programs that are predictable, effective and measurable, and complement your existing development process.

INTEGRATED APPLICATION SECURITY

Dedicated Application Security Expertise:

Over a one-year period, a dedicated Saltworks team of application security professionals will assist with the ongoing management of your application security program:

- } Maturity Model & Planning
- } Policy & Procedure Development
- } Architecture & Threat Modeling
- } Risk-Based Vulnerability Review
- } Developer Guidance & Support
- } Executive Metrics & Reporting

SaltMiner

Saltworks Security's solution for **enterprise application security management**.

One of the biggest problems enterprises have in managing their application security programs is combining and understanding testing results gathered from different tools and services, each with their own dashboards and results.

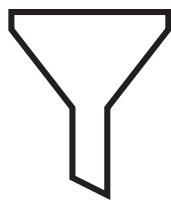

With SaltMiner, enterprises have an automated way to aggregate, analyze, and report on results from scans conducted using different technologies, and to do it at scale.

SaltMiner Helps Enterprises:

- } See all vulnerabilities across all applications in an entire organization in a single dashboard view
- } Manage thousands of applications and scans, and all the testers who interact with them
- } Aggregate and analyze application testing results no matter their technology of origin
- } Prove compliance by ensuring applications are being tested with the right technology at the right time in the right order

A true enterprise-wide picture of application security risk and needs

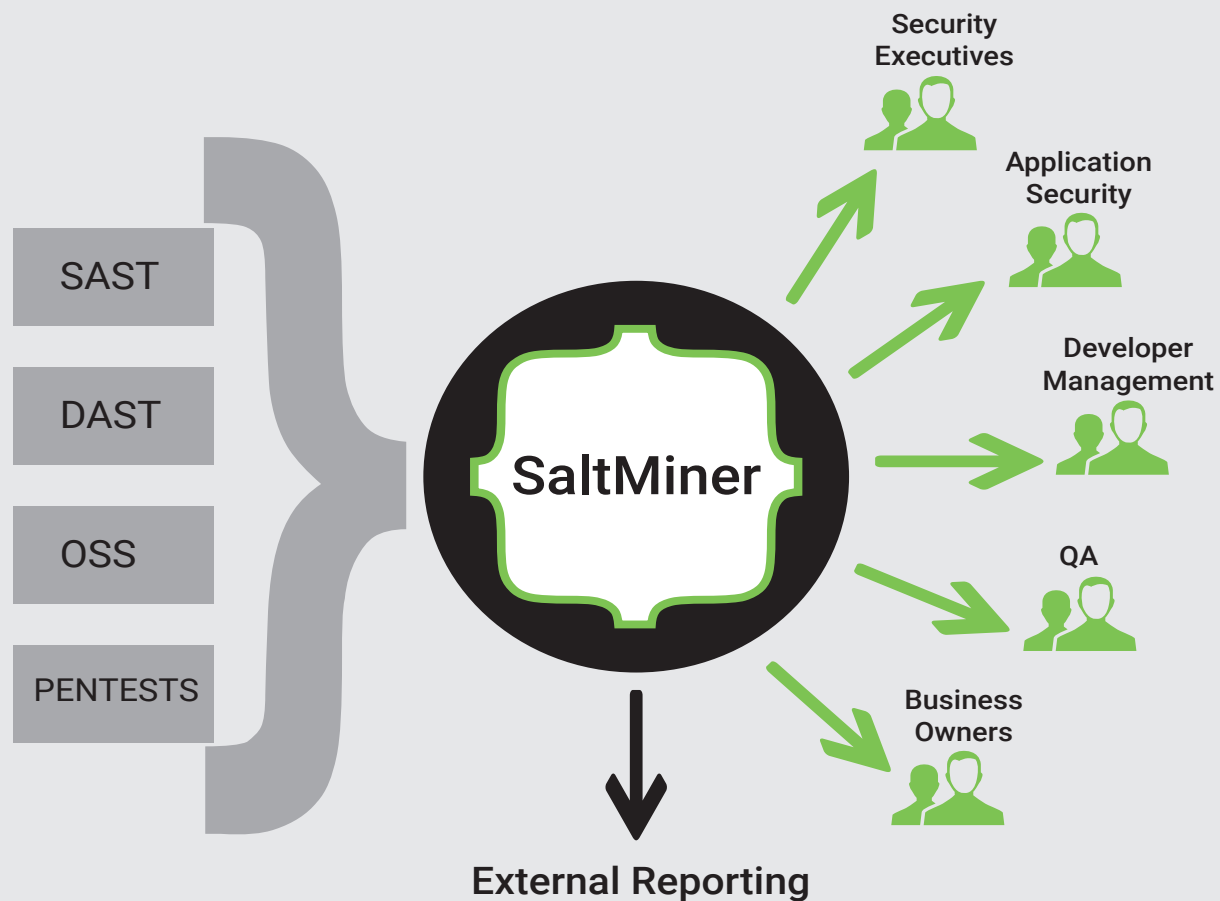

Drill-down and customizable reporting filterable by business unit/owner, vulnerability type, criticality level, IP range, vulnerability trends, and more

Exportable application security results and data for GRC, SOCs, other dashboards, etc.

Focused vulnerability reports for testers that maximize their efforts

Executive Metrics and Trend Reporting

CISOs need to understand their application security risk across their entire organization. SaltMiner delivers customizable executive metrics for unparalleled enterprise-wide understanding of organizational risk and needs.

Application security changes over time, even if no code changes have been made. It changes because new vulnerabilities are discovered, patches aren't applied, and testers have more demands than can be met. SaltMiner trend reporting helps prove not only compliance with results, but also by showing how applications are tested.

The First True Enterprise AppSec Management Tool and Data Warehouse

Managing results generated from different scans, scanners, and testers requires constant manual effort. SaltMiner revolutionizes application security management by combining testing results no matter what their tool of origin, serving as a result reporting repository and true enterprise wide application security management tool.
